In the DFT calculation in the Kohn-Sham formalism we have:

Find a set of orthonormal orbitals  $\Psi_i(\mathbf{r})$  that minimizes:

$$E = -\frac{1}{2} \sum_{i=1}^{N/2} \int \Psi_i^*(\mathbf{r}) \nabla^2 \Psi_i(\mathbf{r}) d\mathbf{r} + \frac{1}{2} \int \rho(\mathbf{r}) V_H(\mathbf{r}) d\mathbf{r} \\ + E_{xc}[\rho(\mathbf{r})] + \int V_{ext}(\mathbf{r}) \rho(\mathbf{r}) d\mathbf{r}$$

where

$$\rho(\mathbf{r}) = 2 \sum_{i=1}^{N/2} \Psi_i^*(\mathbf{r}) \Psi_i(\mathbf{r}) \\ \nabla^2 V_H(\mathbf{r}) = -4\pi\rho(\mathbf{r})$$

The external environment modifies the approach

What *means* environment in a DFT calculation?

## Short-range, environment-independent operators

- Ionic potential, pseudopotentials
- XC potential (at least in LDA)

## Environment-dependent operators

- Kinetic operator (Laplacian)
- Coulomb Operator

Results are sensible to the boundary conditions.

## Environment-modeling operators

- External Electric field → real-space potential
- Continuum solvents → correction to Coulomb operator

A real-space treatment is imperative

## Different operators

Daubechies:

- Kinetic energy
- Scalar products,  $V_{nl}$

Interpolating SF:

- $V_{loc}$  (gaussians)
- XC ( $\rho$  needed)
- Hartree :  $\nabla^2 V_H = \rho$

## Numerical operations

- Convolutions with **short** filters
- Scalar products
- FFT (Poisson Solver)

Interpolating

During the minimization procedure we need to perform

## Poisson's equation

Calculation of the self-consistent potential:

$$\nabla^2 V_H(\mathbf{r}) = -4\pi\rho(\mathbf{r})$$

Such equation should be solved at each minimisation iteration. Need of having an efficient and accurate formalism.

## Plane waves approach

The most common approach. Uses the fourier components

$$f(x, y, z) = \sum_{p_x, p_y, p_z} e^{-2\pi i \left( \frac{p_x}{L_x} x + \frac{p_y}{L_y} y + \frac{p_z}{L_z} z \right)} f_{p_x, p_y, p_z}$$

The Poisson equation is algebraic in the Fourier coefficients

Surfaces BC  
Performances

Code  
capabilities

Outlook

The Laplacian is diagonal in Plane waves representation

## Immediate solution

$$V_{p_x, p_y, p_z} = \frac{1}{\pi} \frac{1}{\left(\frac{p_x}{L_x}\right)^2 + \left(\frac{p_y}{L_y}\right)^2 + \left(\frac{p_z}{L_z}\right)^2} \rho_{p_x, p_y, p_z},$$

## Characteristics

- Simple and fast, easy to parallelize (FFT)
  - Automatically implement Periodic BC on a finite volume
  - Do not fix the value of  $V_{0,0,0}$
- ⇒ May result in problems for systems with other BC

How to solve this equation for other BC?

# Problems with Plane Wave expansion

Surfaces BC

Performances

Code

capabilities

Outlook

How to remove long-distance interactions?

- Model their effect and subtract it
  - Good for integrated quantities (e.g. total energy) but still inefficient for the local values  $V(\mathbf{r})$
  - The **size**  $L$  of the effective system must be **enlarged** wrt the original one
- Modify the kernel operator  $K = K_{\text{short}} + K_{\text{long}}$ 
  - Does not implement well short-distance behaviour, resulting in errors
  - These errors **decrease** when the **size** of the system is large

**In both cases**

We must consider a size that is larger than the size of the original system

# Isolated BC: the Green function treatment

Poisson  
Solver

Complex  
environments

Poisson Solver

Free BC

Poisson Kernel

Performances

Surfaces BC

Performances

Code  
capabilities

Outlook

Consider the Poisson equation for isolated BC. In this case the solution is given by

Green's function for Free BC (kernel)

$$\nabla^2 \frac{1}{r} = -4\pi\delta(r) \implies V(\mathbf{r}) = \int d\mathbf{r}' \frac{\rho(\mathbf{r}')}{|\mathbf{r} - \mathbf{r}'|}$$

An unambiguous solution

Such prescription is unique and is compatible with Free BC.  
How to implement it?

Plane-wave based approaches:

- Truncated kernel, numerically or analytically
- Screening Functions

Approximate treatment, large box required.

Need of an accurate and efficient algorithm

A convenient basis for an electrostatic problem

## Interpolating Scaling Functions

A set of localised functions centered on the nodes of a uniform mesh

$$\varphi_j(x) = \varphi_0(x - j)$$

Undergo multiscale relation

$$\varphi(x) = \sum_{j=-m}^m \underbrace{h_j}_{\text{filters}} \varphi(2x - j)$$

- ✓ The expansion coefficients are the **real space values**  
 $\rho_{j_x, j_y, j_z} = \rho(h_x j_x, h_y j_y, h_z j_z)$
- ✓ Represents exactly an order  $m$  polynomial
- ✓ The first  $m$  discrete and continuous moments coincide

# A finite three-dimensional convolution

Poisson  
Solver

Complex  
environments

Poisson Solver

Free BC

Poisson Kernel

Performances

Surfaces BC

Performances

Code  
capabilities

Outlook

The expression of the potential in this basis is thus intuitive:

$$V(\mathbf{i}) = \sum_{\mathbf{j}} K_{\mathbf{ij}} \rho_{\mathbf{j}}$$

Where the central object is the

Poisson Kernel in the ISF basis

$$K_{\mathbf{ij}} = K_{\mathbf{i-j}}, \quad K_{\mathbf{i}} = \int K(|\mathbf{r}|) \phi_{\mathbf{i}}(\mathbf{r}) d\mathbf{r}, \quad K(r) = \frac{1}{r}$$

Values of the potential are obtained via a convolution

$$V(\mathbf{i}) = \sum_{\mathbf{j}} K_{\mathbf{i-j}} \rho_{\mathbf{j}}$$

It can be treated via a zero-padded FFT algorithm

- ✓ Exact, easy to parallelize (FFT)
- ✓ For a box of  $N^3$  points, it reduces the scaling from  $O(N^6)$  to  $O(N^3 \log N)$

# Characteristics of the approach

Poisson  
Solver

Complex  
environments

Poisson Solver

Free BC

Poisson Kernel

Performances

Surfaces BC

Performances

Code

capabilities

Outlook

This approach is:

- Explicit, guarantees the good BC
- Real space-based, immediate interpretation of the expansion coefficients
- Can be combined with other real-space treatments of the density (e.g. XC)
- Can be used **independently** from the BigDFT code
- Preserves the first  $m$  (multipole) moments of the electrostatic potential

**Requires only the evaluation of the kernel**

We need to evaluate  $N^3$  integrals  $K_i = \int K(|\mathbf{r}|)\varphi_i(\mathbf{r})d\mathbf{r}$   
where  $\varphi_i(\mathbf{r}) = \varphi_{i_x}(x)\varphi_{i_y}(y)\varphi_{i_z}(z)$

**ISF basis is a tensor product**

# Gaussian tensor product decomposition

It can be shown that (Beylkin et al.)

## Approximation with gaussians

$$\frac{1}{r} \simeq \sum_k \omega_k e^{-\rho_k r^2}$$

with  $k = 1, \dots, 89$ ,  $\rho_k$ ,  $\omega_k$  suitably chosen

Accuracy of  $10^{-8}$  for  $r \in (10^{-9}, 1)$

We can rescale for  $R \in (0, L)$ .

The computational cost is reduced  $N^3 \rightarrow 89 \times N$

$$K_j = \sum_{k=1}^{89} \omega_k K_{j_x}(\rho_k) K_{j_y}(\rho_k) K_{j_z}(\rho_k)$$

$$K_j(\rho) = \int \varphi_0(x) e^{-\rho(x-j)^2} dx$$

Outlook

The computational cost is reduced  $N^3 \rightarrow 89 \times N$ .

## Moreover

The scaling property of the interpolets

$$\varphi_0(x/2) = \sum_j h_j \varphi_j(x),$$

Implies similar condition of the one-dimensional function

$$K_j(4\rho) = \frac{1}{2} \sum_j h_j K_{2i-j}(\rho).$$

Thus we can evaluate the integrals for low  $\rho$  (not too sharp gaussians), then rescaling.

ISF properties allows us to gain in accuracy

Surfaces BC

Performances

Code  
capabilities

Outlook

In summary, we have developed a technique

- Free boundary conditions
- Very high accuracy
- Good computational performance, easy to parallelize
- Can be used also in other contexts and/or combined with other treatment (e.g. XC)

In BigDFT code, for big systems it represents a small amount (typical values are less than 2-3% for big systems) of the overall computation

Outlook

The same formalism can be applied to other BC

## Surfaces BC

A domain isolated in one direction (say  $y$ ) and periodic in  $x$  and  $z$ , with periods  $L_x$  and  $L_z$ . A function  $f$  which lives in such a domain can be expanded as

$$f(x, y, z) = \sum_{p_x, p_z} e^{-2\pi i \left( \frac{p_x}{L_x} x + \frac{p_z}{L_z} z \right)} f_{p_x, p_z}(y)$$

without any loss of generality.

## Mixed representation

For such functions the Poisson's equation become

$$\left( \partial_y^2 - \mu_{p_x, p_z}^2 \right) V_{p_x, p_z}(y) = \rho_{p_x, p_z}(y),$$

where  $\mu_{p_x, p_z}^2 = 4\pi^2 \left( \frac{p_x}{L_x} \right)^2 + \left( \frac{p_z}{L_z} \right)^2$ .

# A Green's function formalism

environments

Poisson Solver

Free BC

Poisson Kernel

Performances

Surfaces BC

Performances

Code  
capabilities

Outlook

The Green's function for the one-dimensional Helmholtz equation can be used

$$(\partial_y^2 - \mu^2) G(\mu; y) = \delta(y) ;$$

$$G(\mu; y) = \begin{cases} -\frac{1}{2\mu} e^{-\mu|y|} & \mu > 0 \\ \frac{1}{2}|y| & \mu = 0 \end{cases} ,$$

the components of the potential can be carried out:

**A Green's function for each Fourier component**

$$V_{p_x, p_z}(y) = \int dy' G(\mu_{p_x, p_z}; y - y') \rho_{p_x, p_z}(y') .$$

We can use Interpolating Scaling Functions for the Isolated direction.

# Surfaces BC with Mixed representation

Poisson  
Solver

Complex  
environments

Poisson Solver

Free BC

Poisson Kernel

Performances

Surfaces BC

Performances

Code

capabilities

Outlook

By defining the one-dimensional kernels

$$K(\mu_{\rho_x, \rho_z}; j) = \int G(\mu_{\rho_x, \rho_z}; y) \phi_j(y) dy$$

We can have a treatment similar to the Free BC case

1-dim convolution for each reciprocal space component

$$V_{\rho_x, \rho_z}(i) = \sum_j K(\mu_{\rho_x, \rho_z}; i - j) \rho_{\rho_x, \rho_z}(j)$$

From mixed representation to full real space

The calculation can be performed with a (semi-)zero-padded FFT algorithm. The I/O are function of the real domain.

# Speed-up the calculation

Poisson  
Solver

Complex  
environments

Poisson Solver

Free BC

Poisson Kernel

Performances

Surfaces BC

Performances

Code  
capabilities

Outlook

The calculation of the kernel can be improved

## Speed

The analytic form of the Green functions allows for recursion relations

→ improvement in speed of a factor of  $(N_z + 1)/3$

## Accuracy

The scaling relation will again help in the kernel

$$K(2\mu; j) = \frac{1}{2} \sum_j h_j K(2\mu, 2i - j)$$

## A “Free-Lunch” case

We have the same advantages of the Free BC treatment with an explicit formalism conceived for surfaces BC

Outlook

## Flexible Boundary Conditions

- Isolated (free) BC
- Surfaces BC
- Periodic (3D) BC

## Not only for Hartree terms

Exact exchange operator can be expressed **accurately**

Explicit BC, unambiguous offset (0th Fourier component)

## E.g.: Surfaces BC

2D Periodic + 1D isolated

Optimal to treat dipolar systems

**without** corrections

# Daubechies wavelets: flexibility *and* precision

Poisson  
Solver

Complex  
environments

Poisson Solver

Free BC

Poisson Kernel

Performances

Surfaces BC

Performances

Code  
capabilities

Outlook

The real-space description allows for easy and explicit implementation of different BC

- Kinetic operator: periodic or isolated BC easy to implement
- External perturbations: real-space based, do not have to fulfill any constraint (e.g. periodicity)

## Orthogonality, multi-resolution

**No interpolation:** Thanks to wavelet properties we **do not** need any numerical approximation to evaluate hamiltonian-related quantities in Daubechies basis

## Systematicity

Convergence rate is driven by the basis completeness by decreasing the grid spacing we are guaranteed to have better accuracy

# Summary and outlook

Poisson  
Solver

environments

Poisson Solver

Free BC

Poisson Kernel

Performances

Surfaces BC

Performances

Code

capabilities

Outlook

Interpolating SF can be use to solve the Poisson's equation

$$\nabla^2 V_H = -4\pi\rho$$

with a **Green's function** treatment, in different environnements:

Isolated BC

$$V_H(\vec{j}) = \int d\vec{x} \frac{\rho(\vec{x})}{|\vec{x}-\vec{j}|}$$

Surfaces BC

$$V_{\rho_x, \rho_z}(y) = \int dy' G(\mu_{\rho_x, \rho_z}; y - y') \rho_{\rho_x, \rho_z}(y')$$

From  $\rho(\vec{j})$  on a uniform grid

Explicit treatment of the boundary conditions

Can be generalised to other environments

- Wires BC
- Spherical heterostructures (multipole expansion)
